8. **The title of the invention:** Cost effective maintenance free electrical grounding systems.
9. **The abstract:** The invention presented herein features a safe, cost effective, durable and maintenance free electrical grounding system that provides very low electrical resistance.

The two complementary inventions presented relies on the use of steel wire meshes and (or) long continuous bunched steel fibres embedded in conductive cement matrix to provide consistently lower electrical resistance (0.2-0.5 Ohm.cm) while simultaneously providing high mechanical strength. The long bunched steel fibres and (or) steel wire meshes used essentially short circuits the entire mass of the electrical earth material composite by readily connecting electrically the short conductive fibres and the conductive particles suspended in the composite. The earthing composite mass act as an extension of the earth electrode (encapsulated within) thus drastically increasing the surface contact area with the surrounding soil and thereby greatly lowering grounding resistance. This invention also provides safer voltage gradient characteristics and lower surge impedance and is therefore a superior alternative for electrical grounding and related industrial applications. The second invention uses the same earthing material described in the first invention to provide a novel and an effective earthing electrode designed to leverage on various benefits of larger electrode surface-soil contact, deeper rod electrode driven into soil, and on the benefits rendered by conductive cement.
